

Anchored price response

$\kappa(t+h)$	Workday		Rest day	
$g(i)$	day	night	day	night
Low-density	○	◐	◐	◐
Residential	○	●	●	●
Commercial	○	●	◐	●

(illustrative)

$\hat{\beta}_{g,\kappa} \pm se$: fixed buffers
TOU switch events, design D

- own cell
- ◐ pooled across groups
- pooled city-wide

pooled upward if $n_{zones} < 10$ or $se > 0.5$

$$\eta_{i,t+h} = \beta_{g(i),\kappa(t+h)} \Delta \ell_{i,t+h} + \sum_k \delta_k S_{i,t+h}^{(k)} [+ \gamma U_{i,t+h}]$$

Cut feedback (default)

no gradient ✂

anchors estimated once from switch events; $\mathcal{L}_{pin}$ trains ϕ only

Joint training (ablations)

$\mathcal{L}_{pin}$ alone cannot identify β (Prop. 1)
A1, A2: β, δ learned; A13: $+ \lambda_a \mathcal{L}_{anc}$
