

Masked adaptive conformal calibration

$s_{\tau,i} = \max(\hat{y}_{\tau,i}^{(0.05)} - y_{\tau,i}, y_{\tau,i} - \hat{y}_{\tau,i}^{(0.95)}) / \sigma_i$ (h -step forecasts; σ_i : training MAD)

$\hat{q}_{t,h}$: $[(n+1)(1-\alpha_{t,h})]/n$ quantile of unfrozen $s_{\tau,i}$, $t-167 \leq \tau \leq t$, all zones

$[\hat{y}^{\text{lo}}, \hat{y}^{\text{hi}}] = [\hat{y}^{(0.05)} - \sigma_i \hat{q}_{t,h}, \hat{y}^{(0.95)} + \sigma_i \hat{q}_{t,h}]$ for target $t+h$

$\alpha_{t,h} = \alpha_{t-1,h} + \gamma_{\text{ACI}}(\alpha - \text{err}_{t,h})$; err: miscovered share of unfrozen zones
